# Fixed Point Theorems in Fuzzy Metric Spaces 

Dr. C. Vijender<br>Department of Mathematics, Sreenidhi Institute of Sciece and Technology, Hyderabad, Andhra Pradesh, India

#### Abstract

In this paper, we state and prove some common fixed point theorems in fuzzy metric spaces. These theorems generalize and improve known results (see [1]).

Keywords : Fixed point, Fuzzy metric spaces, Fuzzy mapping.

## I. INTRODUCTION

In 1965, the theory of fuzzy sets was investigated by Zadeh [2]. In 1981, Heilpern [3] first introduced the concept of fuzzy contractive mappings and proved a fixed point theorem for these mappings in metric linear spaces. His result is a generalization of the fixed point theorem for point-to-set maps of Nadler [4]. Therefore, several fixed point theorems for types of fuzzy contractive mappings have appeared (see, for instance [1,5-9]).

In this paper, we state and prove some common fixed point theorems in fuzzy metric spaces. These theorems generalize and improve known results (see [1]).

## II. METHODS AND MATERIAL

## Basic Preliminaries

The definitions and terminologies for further discussions are taken from Heilpern [3]. Let $(X, d)$ be a metric linear space. A fuzzy set in $X$ is a function with domain $X$ and values in $[0,1]$. If $A$ is a fuzzy set and $x \in X$, then the function-value $A(x)$ is called the grade of membership of $x$ in $A$. The collection of all fuzzy sets in $X$ is denoted by $\mathrm{I}(\mathrm{X})$.

Let $\mathrm{A} \in \mathrm{I}(\mathrm{X})$ and $\alpha \in[0,1]$. The $\alpha$-level set of $A$, denoted by $A_{\alpha}$, is defined by
$\mathrm{A}_{\alpha}=\{\mathrm{x}: \mathrm{A}(\mathrm{x}) \geqslant \alpha\}$ if $\alpha \in(0,1], \mathrm{A}_{0}=\overline{\{\mathrm{x}: \mathrm{A}(\mathrm{x})>0\}}$, whenever $\overline{\mathrm{B}}$ is the closure of set (non-fuzzy) $B$.

## Definition 2.1

A fuzzy set $A$ in $X$ is an approximate quantity iff its $\alpha$ level set is a nonempty compact convex subset (nonfuzzy) of $X$ for each $\alpha \in[0,1]$ and $\sup _{x \in X} A(x)=1$.
The set of all approximate quantities, denoted by $W(X)$, is a subcollection of $\mathrm{I}(\mathrm{X})$.

## Definition 2.2

Let $A, B \in W(X), \alpha \in[0,1]$ and $C P(X)$ be the set of all nonempty compact subsets of $X$. Then
$\mathrm{p}_{\alpha}(\mathrm{A}, \mathrm{B})=\inf _{x \in A_{\alpha}, y \in B_{\alpha}} \mathrm{d}(\mathrm{x}, \mathrm{y}), \delta_{\alpha}(\mathrm{A}, \mathrm{B})=\sup _{x \in A_{\alpha}, y \in B_{\alpha}} \mathrm{d}(\mathrm{x}, \mathrm{y})$
and $\mathrm{D}_{\alpha}(\mathrm{A}, \mathrm{B})=\mathrm{H}\left(\mathrm{A}_{\alpha}, \mathrm{B}_{\alpha}\right)$,
where $H$ is the Hausdorff metric between two sets in the collection $C P(X)$. We define the following functions
$\mathrm{p}(\mathrm{A}, \mathrm{B})=\sup _{\alpha} \mathrm{p}_{\alpha}(\mathrm{A}, \mathrm{B}), \delta(\mathrm{A}, \mathrm{B})=\sup _{\alpha} \delta_{a}(\mathrm{~A}, \mathrm{~B})$ and $\mathrm{D}(\mathrm{A}$,
$B)=\sup _{\alpha} \mathrm{D}_{a}(\mathrm{~A}, \mathrm{~B})$.
It is noted that $p_{\alpha}$ is nondecreasing function of $\alpha$.

## Definition 2.3

Let $A, B \in W(X)$. Then $A$ is said to be more accurate than $B$ (or $B$ includes $A$ ), denoted by $A \subset B$, iff $A(x) \leqslant B(x)$ for each $x \in X$.
The relation $\subset$ induces a partial order on $W(X)$.

## Definition 2.4

Let $X$ be an arbitrary set and $Y$ be a metric linear space. $F$ is said to be a fuzzy mapping iff $F$ is a mapping from the set $X$ into $W(Y)$, i.e., $F(x) \in W(Y)$ for each $x \in X$.
The following proposition is used in the sequel.

## Proposition 2.1

([4]). If $A, B \in C P(X)$ and $a \in A$, then there exists $b \in B$ such that $d(a, b) \leqslant H(A, B)$.
Following Beg and Ahmed [10], let ( $X, d$ ) be a metric space. We consider a subcollection of $\mathrm{I}(\mathrm{X})$ denoted by $W^{*}(X)$. Each fuzzy set $A \in W^{*}(x)$, its $\alpha$-level set is a nonempty compact subset (non-fuzzy) of $X$ for each $\alpha \in[0,1]$. It is obvious that each element $A \in W(X)$ leads to $A \in W^{*}(X)$ but the converse is not true.
The authors [10] introduced the improvements of the lemmas in Heilpern [3] as follows.

## Lemma 2.1

If $\left\{x_{0}\right\} \subset A$ for each $A \in W^{*}(X)$ and $x_{0} \in X$, then $p_{\alpha}\left(x_{0}, B\right) \leqslant D_{\alpha}(A, B)$ for each $B \in W^{*}(X)$.

## Lemma 2.2

$p_{\alpha}(x, A) \leqslant d(x, y)+p_{\alpha}(y, A) \quad$ for all $x, \quad y \in X$ and $A \in W^{*}(X)$.

## Lemma 2.3

Let $x \in X, A \in W^{*}(X)$ and $\{x\}$ be a fuzzy set with membership function equal to a characteristic function of the set $\{x\}$. Then $\{x\} \subset A$ if and only if $p_{\alpha}(x, A)=0$ for each $\alpha \in[0,1]$.

## Lemma 2.4

Let $(X, d)$ be a complete metric space, $F: X \rightarrow W^{*}(X)$ be a fuzzy map and $x_{0} \in X$. Then there exists $x_{1} \in X$ such that $\left\{x_{1}\right\} \subset F\left(x_{0}\right)$.

## Remark 2.1

It is clear that Lemma 2.4 is a generalization of corresponding lemma in Arora and Sharma [1] and Proposition 3.2 in Lee and Cho [7].
Let $\Psi$ be the family of real lower semi-continuous functions $F:[0, \infty)^{6} \rightarrow R, R:=$ the set of all real numbers, satisfying the following conditions:
$\left(\psi_{1}\right) \quad F$ is non-increasing in 3rd, 4th, 5th, 6th coordinate variable,
$\left(\psi_{2}\right)$ there exists $h \in(0,1)$ such that for every $u, v \geqslant 0$ with
$\left(\psi_{21}\right) F(u, v, v, u, u+v, 0) \leqslant 0$ or
$\left(\psi_{22}\right) F(u, v, u, v, 0, u+v) \leqslant 0$, we have $u \leqslant h v$, and $\left(\psi_{3}\right) F(u, u, 0,0, u, u)>0$ for all $u>0$.

## III. RESULTS AND DISCUSSION

In 2000, Arora and Sharma [1] proved the following result.

## Theorem 3.1

Let $(X, d)$ be a complete metric space and $T_{1}, T_{2}$ be fuzzy mappings from $X$ into $W(X)$. If there is a constant $q$, $0 \leqslant q<1$, such that, for each $x, y \in X$,
$\mathrm{D}\left(\mathrm{T}_{1}(\mathrm{x}), \mathrm{T}_{2}(\mathrm{y})\right) \leqslant \mathrm{q} \max \left\{\mathrm{d}(\mathrm{x}, \mathrm{y}), \mathrm{p}\left(\mathrm{x}, \mathrm{T}_{1}(\mathrm{x})\right), \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{2}(\mathrm{y})\right)\right.$, $\left.\mathrm{p}\left(\mathrm{x}, \mathrm{T}_{2}(\mathrm{y})\right), \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{1}(\mathrm{x})\right)\right\}$,
then there exists $z \in X$ such that $\{z\} \subset T_{1}(z)$ and $\{z\} \subset T_{2}(z)$.

## Remark 3.1

If there is a constant $q, 0 \leqslant q<1$, such that, for each $x, y \in X$,
$\mathrm{D}\left(\mathrm{T}_{1}(\mathrm{x}), \quad \mathrm{T}_{2}(\mathrm{y})\right) \leqslant \mathrm{q} \quad \max \left\{\mathrm{d}(\mathrm{x}, \quad \mathrm{y}), \quad \mathrm{p}\left(\mathrm{x}, \mathrm{T}_{1}(\mathrm{x})\right)\right.$, $\left.\mathrm{p}\left(\mathrm{y}, \mathrm{T}_{2}(\mathrm{y})\right)\right\}$,
then the conclusion of Theorem 3.1 remains valid. This result is considered as a special case of Theorem 3.1.
Beg and Ahmed [10] generalized Theorem 3.1 as follows.

## Theorem 3.2

Let $(X, d)$ be a complete metric space and $T_{1}, T_{2}$ be fuzzy mappings from $X$ into $W^{*}(X)$. If there is a $F \in \Psi$ such that, for all $x, y \in X$,
$\mathrm{F}\left(\mathrm{D}\left(\mathrm{T}_{1}(\mathrm{x}), \mathrm{T}_{2}(\mathrm{y})\right), \mathrm{d}(\mathrm{x}, \mathrm{y}), \mathrm{p}\left(\mathrm{x}, \mathrm{T}_{1}(\mathrm{x})\right), \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{2}(\mathrm{y})\right)\right.$, $\left.\mathrm{p}\left(\mathrm{x}, \mathrm{T}_{2}(\mathrm{y})\right), \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{1}(\mathrm{x})\right)\right) \leqslant 0$, (2)
then there exists $z \in X$ such that $\{z\} \subset T_{1}(z)$ and $\{z\} \subset T_{2}(z)$.

We give another different generalization of Theorem 3.1 with contractive condition (1) as follows.

## Theorem 3.3

Let $(X, d)$ be a complete metric space and $T_{1}, T_{2}$ be fuzzy mappings from $X$ into $W^{*}(X)$. Assume that there exist $c_{1}$, $c_{2}, c_{3} \in[0, \infty)$ with $c_{1}+2 c_{2}<1$ and $c_{2}+c_{3}<1$ such that, for all $x, y \in X$,

$$
\begin{array}{r}
\mathrm{D}^{2}\left(\mathrm{~T}_{1}(\mathrm{x}), \mathrm{T}_{2}(\mathrm{y})\right) \leqslant \mathrm{c}_{1} \max \left\{\mathrm{~d}^{2}(\mathrm{x}, \mathrm{y}), \mathrm{p}^{2}\left(\mathrm{x}, \mathrm{~T}_{1}(\mathrm{x})\right), \mathrm{p}^{2}(\mathrm{y}\right. \\
\left.\left.\mathrm{T}_{2}(\mathrm{y})\right)\right\}+\mathrm{c}_{2} \max \left\{\mathrm{p}\left(\mathrm{x}, \mathrm{~T}_{1}(\mathrm{x})\right) \mathrm{p}\left(\mathrm{x}, \mathrm{~T}_{2}(\mathrm{y})\right), \mathrm{p}(\mathrm{y}\right.
\end{array}
$$

$$
\begin{equation*}
\left.\left.\mathrm{T}_{1}(\mathrm{x})\right) \mathrm{p}\left(\mathrm{y}, \mathrm{~T}_{2}(\mathrm{y})\right)\right\}+\mathrm{c}_{3} \mathrm{p}\left(\mathrm{x}, \mathrm{~T}_{2}(\mathrm{y})\right) \mathrm{p}\left(\mathrm{y}, \mathrm{~T}_{1}(\mathrm{x})\right) \tag{3}
\end{equation*}
$$

Then there exists $z \in X$ such that $\{z\} \subset T_{1}(z)$ and $\{z\} \subset T_{2}(z)$.

## Proof

Let $x_{0}$ be an arbitrary point in $X$. Then by Lemma 2.4, there exists an element $x_{1} \in X$ such that $\left\{x_{1}\right\} \subset T_{1}\left(x_{0}\right)$. For $x_{1} \in X,\left(T_{2}\left(x_{1}\right)\right)_{1}$ is nonempty compact subset of $X$. Since $\quad\left(T_{1}\left(x_{0}\right)\right)_{1}, \quad\left(T_{2}\left(x_{1}\right)\right)_{1} \in C P(X) \quad$ and $x_{1} \in\left(T_{1}\left(x_{0}\right)\right)_{1}$, then Proposition 2.1 asserts that there exists $x_{2} \in\left(T_{2}\left(x_{1}\right)\right)_{1}$ such that $d\left(x_{1}, x_{2}\right) \leqslant D_{1}\left(T_{1}\left(x_{0}\right), T_{2}\left(x_{1}\right)\right)$. So, we obtain from the inequality $D(A, B) \geqslant D_{a}(A, B) \forall \alpha \in[0,1]$ that

$$
\begin{aligned}
\mathrm{d}^{2}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right) & \leqslant \mathrm{D}_{1}^{2}\left(\mathrm{~T}_{1}\left(\mathrm{x}_{0}\right), \mathrm{T}_{2}\left(\mathrm{x}_{1}\right)\right) \\
& \leqslant \mathrm{D}^{2}\left(\mathrm{~T}_{1}\left(\mathrm{x}_{0}\right), \mathrm{T}_{2}\left(\mathrm{x}_{1}\right)\right) \\
& \leqslant \mathrm{c}_{1} \max \left\{\mathrm{~d}^{2}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right), \mathrm{p}^{2}\left(\mathrm{x}_{0}, \mathrm{~T}_{1}\left(\mathrm{x}_{0}\right)\right), \mathrm{p}^{2}\left(\mathrm{x}_{1}, \mathrm{~T}_{2}\left(\mathrm{x}_{1}\right)\right)\right\} \\
& +\mathrm{c}_{2} \max \left\{\mathrm{p}\left(\mathrm{x}_{0}, \quad \mathrm{~T}_{1}\left(\mathrm{x}_{0}\right)\right) \mathrm{p}\left(\mathrm{x}_{0}, \quad \mathrm{~T}_{2}\left(\mathrm{x}_{1}\right)\right), \quad \mathrm{p}\left(\mathrm{x}_{1},\right.\right. \\
& \left.\left.\mathrm{T}_{1}\left(\mathrm{x}_{0}\right)\right) \mathrm{p}\left(\mathrm{x}_{1}, \mathrm{~T}_{2}\left(\mathrm{x}_{1}\right)\right)\right\} \\
& +\mathrm{c}_{3} \mathrm{p}\left(\mathrm{x}_{0}, \mathrm{~T}_{2}\left(\mathrm{x}_{1}\right)\right) \mathrm{p}\left(\mathrm{x}_{1}, \mathrm{~T}_{1}\left(\mathrm{x}_{0}\right)\right) \\
& +\mathrm{c}_{1} \max \left\{\mathrm{~d}^{2}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right), \mathrm{d}^{2}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)\right\}+\mathrm{c}_{2} \mathrm{~d}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right)\left[\mathrm { d } \left(\mathrm{x}_{0},\right.\right. \\
& \left.\left.\mathrm{x}_{1}\right)+\mathrm{d}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)\right] .
\end{aligned}
$$

If $d\left(x_{1}, x_{2}\right)>d\left(x_{0}, x_{1}\right)$, then we have
$\mathrm{d}^{2}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right) \leq\left(\mathrm{c}_{1}+2 \mathrm{c}_{2}\right) \mathrm{d}^{2}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)$,
which is a contradiction. Thus,
$\mathrm{d}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right) \leq \mathrm{hd}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right)$,
where $h=c_{1}+2 c_{2}<1$. Similarly, one can deduce that
$\mathrm{d}\left(\mathrm{x}_{2}, \mathrm{x}_{3}\right) \leq \mathrm{hd}\left(\mathrm{x}_{1}, \mathrm{x}_{2}\right)$.
By induction, we have a sequence $\left(x_{n}\right)$ of points in $X$ such that, for all $n \in N \cup\{0\}$,
$\left\{\mathrm{x}_{2 \mathrm{n}+1}\right\} \mathrm{T}_{1}\left(\mathrm{x}_{2 \mathrm{n}}\right),\left\{\mathrm{x}_{2 \mathrm{n}+2}\right\} \mathrm{T}_{2}\left(\mathrm{x}_{2 \mathrm{n}+1}\right)$.
It follows by induction that $d\left(x_{n}, x_{n+1}\right) \leq h^{n} d\left(x_{0}, x_{1}\right)$. Since
$\mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{m}}\right) \leq \mathrm{d}\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}+1}\right)+\mathrm{d}\left(\mathrm{x}_{\mathrm{n}+1}, \mathrm{x}_{\mathrm{n}+2}\right)+\ldots+\mathrm{d}\left(\mathrm{x}_{\mathrm{m}-1}, \mathrm{x}_{\mathrm{m}}\right) \leq$ $\mathrm{h}^{\mathrm{n}} \mathrm{d}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right)+\mathrm{h}^{\mathrm{n}+1} \mathrm{~d}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right)+\ldots+\mathrm{h}^{\mathrm{m}-1} \mathrm{~d}\left(\mathrm{x}_{0}, \mathrm{x}_{1}\right) \leq \frac{h^{n}}{1-h} \mathrm{~d}\left(\mathrm{x}_{0}\right.$, $\mathrm{x}_{1}$ ),
then $\lim _{n, m \rightarrow \infty} d\left(x_{n}, x_{m}\right)=0$. Therefore, $\left(x_{n}\right)$ is a Cauchy sequence. Since $X$ is complete, then there exists $z \in X$ such that $\lim _{n \rightarrow \infty} x_{n}=z$. Next, we show that $\{z\} \subset T_{i}(z), i=1,2$. Now, we get from Lemmas 2.1 and $\underline{2.2}$ that
$\mathrm{p}_{\alpha}\left(\mathrm{z}, \mathrm{T}_{2}(\mathrm{z})\right) \leq \mathrm{d}\left(\mathrm{z}, \quad \mathrm{x}_{2 \mathrm{n}+1}\right)+\mathrm{p}_{\alpha}\left(\mathrm{x}_{2 \mathrm{n}+1}, \quad \mathrm{~T}_{2}(\mathrm{z})\right) \leq \mathrm{d}(\mathrm{z}$, $\left.\mathrm{x}_{2 \mathrm{n}+1}\right)+\mathrm{D}_{\alpha}\left(\mathrm{T}_{1}\left(\mathrm{x}_{2 \mathrm{n}}\right), \mathrm{T}_{2}(\mathrm{z})\right)$,
for each $\alpha \in[0,1]$. Taking supremum on $\alpha$ in the last inequality, we obtain that

$$
\begin{equation*}
\mathrm{p}\left(\mathrm{z}, \mathrm{~T}_{2}(\mathrm{z})\right) \leq \mathrm{d}\left(\mathrm{z}, \mathrm{x}_{2 \mathrm{n}+1}\right)+\mathrm{D}\left(\mathrm{~T}_{1}\left(\mathrm{x}_{2 \mathrm{n}}\right), \mathrm{T}_{2}(\mathrm{z})\right) \tag{4}
\end{equation*}
$$

From the inequality (3), we have that
$\mathrm{D}_{2}\left(\mathrm{~T}_{1}\left(\mathrm{x}_{2 \mathrm{n}}\right), \mathrm{T}_{2}(\mathrm{z})\right) \leq \mathrm{c}_{1} \max \left\{\mathrm{~d}^{2}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{z}\right), \mathrm{p}^{2}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{T}_{1}\left(\mathrm{x}_{2 \mathrm{n}}\right)\right), \mathrm{p}^{2}(\mathrm{z}\right.$, $\mathrm{T}_{2}(\mathrm{z})$ ) $\}$
$+\mathrm{c}_{2} \max \left\{\mathrm{p}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{T}_{1}\left(\mathrm{x}_{2 \mathrm{n}}\right)\right) \mathrm{p}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{T}_{2}(\mathrm{z})\right), \mathrm{p}\left(\mathrm{z}, \mathrm{T}_{1}\left(\mathrm{x}_{2 \mathrm{n}}\right)\right) \mathrm{p}\left(\mathrm{z}, \mathrm{T}_{2}(\mathrm{z})\right)\right\}$
$+\mathrm{c}_{3} \mathrm{p}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{T}_{2}(\mathrm{z})\right) \mathrm{p}\left(\mathrm{z}, \mathrm{T}_{1}\left(\mathrm{x}_{2 \mathrm{n}}\right)\right)$
$\leq \mathrm{c}_{1} \max \left\{\mathrm{~d}^{2}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{z}\right), \mathrm{d}^{2}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{x}_{2 \mathrm{n}+1}\right), \mathrm{p}^{2}\left(\mathrm{z}, \mathrm{T}_{2}(\mathrm{z})\right)\right\}$
$+\mathrm{c}_{2} \max \left\{\mathrm{~d}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{x}_{2 \mathrm{n}+1}\right) \mathrm{p}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{T}_{2}(\mathrm{z})\right), \mathrm{d}\left(\mathrm{z}, \mathrm{x}_{2 \mathrm{n}+1}\right) \mathrm{p}\left(\mathrm{z}, \mathrm{T}_{2}(\mathrm{z})\right)\right\}$
$+\mathrm{c}_{3} \mathrm{p}\left(\mathrm{x}_{2 \mathrm{n}}, \mathrm{T}_{2}(\mathrm{z})\right) \mathrm{d}\left(\mathrm{z}, \mathrm{x}_{2 \mathrm{n}+1}\right)$.

Letting $n \rightarrow \infty$ in the inequalities (4) and (5), it follows that
$\mathrm{p}\left(\mathrm{z}, \mathrm{T}_{2}(\mathrm{z})\right) \leq \mathrm{c}_{1} \mathrm{p}\left(\mathrm{z}, \mathrm{T}_{2}(\mathrm{z})\right)$.
Since $c_{1}<1$, we see that $p\left(z, T_{2}(z)\right)=0$. So, we get from Lemma 2.3 that $\{z\} \subset T_{2}(z)$. Similarly, one can be shown that $\{z\} \subset T_{1}(z)$.

## Remark 3.2

(I) Condition (3) is not deducible from condition (2) since the function $F$ from $[0, \infty)^{6}$ into $[0, \infty)$ defined as
$\mathrm{F}\left(\mathrm{t}_{1}, \mathrm{t}_{2}, \mathrm{t}_{3}, \mathrm{t}_{4}, \mathrm{t}_{5}, \mathrm{t}_{6}\right)=\mathrm{t}_{1}{ }^{2}-\mathrm{c}_{1} \max \mathrm{t}_{2}{ }^{2}, \mathrm{t}_{3}{ }^{2}, \mathrm{t}_{4}{ }^{2}-\mathrm{c}_{2} \max \left\{\mathrm{t}_{3} \mathrm{t}_{5}, \mathrm{t}_{6} \mathrm{t}_{4}\right\}-\mathrm{c}_{3} \mathrm{t}_{5} \mathrm{t}_{6}$, for all $t_{1}, t_{2}, t_{3}, t_{4}, t_{5}, t_{6} \in[0, \infty)$, where $c_{1}, c_{2}, c_{3} \in[0, \infty)$ with $c_{1}+2 c_{2}<1$ and $c_{2}+c_{3}<1$, does not generally satisfy condition $\left(\psi_{3}\right)$. Indeed, we have that
$\mathrm{F}(\mathrm{u}, \mathrm{u}, 0,0, \mathrm{u}, \mathrm{u})=\mathrm{u}^{2}-\mathrm{c}_{1} \mathrm{u}^{2}-\mathrm{c}_{3} \mathrm{u}^{2}$, for all $u>0$ and does not imply that $F(u, u, 0,0, u, u)>0$ for all $u>0$.

It suffices to consider $\mathrm{c}_{1}=\frac{3}{4}, \mathrm{c}_{2}=\frac{1}{9}, \mathrm{c}_{3}=\frac{1}{2}$ and then $c_{1}+2 c_{2}<1 \quad$ and $c_{2}+c_{3}<1$ but $F(u, u, 0,0, u, u)<0 \quad$ for all $u>0$. Therefore, Theorems 3.2 and 3.3 are two different generalizations of Theorem 3.1 with contractive condition (1).
(II) If there exist $c_{1}, c_{2}, c_{3} \in[0, \infty)$ with $c_{1}+2 c_{2}<1$ and $c_{2}+c_{3}<1$ such that, for all $x, y \in X$,
$\delta^{2}\left(\mathrm{~T}_{1}(\mathrm{x}), \mathrm{T}_{2}(\mathrm{y})\right) \leq \mathrm{c}_{1} \max \left\{\mathrm{~d}^{2}(\mathrm{x}, \mathrm{y}), \mathrm{p}^{2}\left(\mathrm{x}, \mathrm{T}_{1}(\mathrm{x})\right), \mathrm{p}^{2}\left(\mathrm{y}, \mathrm{T}_{2}(\mathrm{y})\right)\right\}$ $+\mathrm{c}_{2} \max \left\{\mathrm{p}\left(\mathrm{x}, \mathrm{T}_{1}(\mathrm{x})\right) \mathrm{p}\left(\mathrm{x}, \mathrm{T}_{2}(\mathrm{y})\right), \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{1}(\mathrm{x})\right) \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{2}(\mathrm{y})\right)\right\}$
$+\mathrm{c}_{3} \mathrm{p}\left(\mathrm{x}, \mathrm{T}_{2}(\mathrm{y})\right) \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{1}(\mathrm{x})\right)$,
then the conclusion of Theorem 3.3 remains valid. This result is considered as a special case of Theorem 3.3 because $D\left(F_{1}(x), F_{2}(y)\right) \leq \delta\left(F_{1}(x), F_{2}(y)\right)$. Moreover, this result generalizes Theorem 3.3 of Park and Jeong [8].

## Theorem 3.4

Let $\left(T_{n}: n N \cup\{0\}\right)$ be a sequence of fuzzy mappings from a complete metric space $(X, d)$ into $W^{*}(X)$. Assume that there exist $c_{1}, c_{2}, c_{3} \in[0, \infty)$ with $c_{1}+2 c_{2}<1$ and $c_{2}+c_{3}<1$ such that, for all $x, y \in X$,
$\mathrm{D}^{2}\left(\mathrm{~T}_{0}(\mathrm{x}), \mathrm{T}_{\mathrm{n}}(\mathrm{y})\right) \leq \mathrm{c}_{1} \max \left\{\mathrm{~d}^{2}(\mathrm{x}, \mathrm{y}), \mathrm{p}^{2}\left(\mathrm{x}, \mathrm{T}_{0}(\mathrm{x})\right), \mathrm{p}^{2}\left(\mathrm{y}, \mathrm{T}_{\mathrm{n}}(\mathrm{y})\right)\right\}$ $+\mathrm{c}_{2} \max \left\{\mathrm{p}\left(\mathrm{x}, \mathrm{T}_{0}(\mathrm{x})\right) \mathrm{p}\left(\mathrm{x}, \mathrm{T}_{\mathrm{n}}(\mathrm{y})\right), \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{0}(\mathrm{x})\right) \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{\mathrm{n}}(\mathrm{y})\right)\right\}$
$+\mathrm{c}_{3} \mathrm{p}\left(\mathrm{x}, \mathrm{T}_{\mathrm{n}}(\mathrm{y})\right) \mathrm{p}\left(\mathrm{y}, \mathrm{T}_{0}(\mathrm{x})\right) \quad \forall \mathrm{n} \in \mathrm{N}$.
Then there exists a common fixed point of the family $\left(T_{n}\right.$ : $n \mathrm{~N} \cup\{0\}$ ).

## Proof

Putting $T_{1}=T_{0}$ and $T_{2}=T_{n} \forall n \in N$ in Theorem 3.3. Then, there exists a common fixed point of the family $\left(T_{n}: n \in N \cup\{0\}\right)$.
