ABSTRACT

Benzaldehyde is best known as being artificial essential oil of almond and it has many other uses such as; the manufacturing of dyes, perfumes, flavourings, cinnamic and mandelic acids, and it is also used as a solvent. Some more recent developments in the use of benzaldehyde are for the health and agriculture industries. Due to these basic reasons there exist a vast field of study of substituted benzaldehydes. In the present study a comparative analysis is done between 3-hydroxy-4-methoxy-benzaldehyde and 4-hydroxy-3-methoxy-benzaldehyde. The spectral studies were performed for FTIR, IR (KBr and Nuzol) and Raman. Quantum mechanical calculations of geometries, energies, vibrational wave numbers and thermodynamic constants have been performed with Gaussian 09W program package using the Becke-3Lee-Yang-Parr (B3LYP) functional supplemented with the standard 6-31G (DP). The optimised geometrical parameters obtained by computational method used shows good agreement with the experimental data. The thermodynamic properties as heat capacity, entropy, enthalpy and Gibb's free energy of the titled compounds at different temperatures were also calculated along with dipole moment, polarisability and hyperpolarisability.

Keywords : 3-hydroxy-4-methoxy-benzaldehyde , 4-hydroxy-3-methoxy-benzaldehyde, vibrational spectral , NLO, Gaussian 09W, DFT/ B3LYP ,thermodynamic parameters, FTIR, dipole moment, polarisability, hyperpolarisability.

I. INTRODUCTION

Benzaldehydes and its derivatives are one of the the simplest in aromatic aldehydes and is known as artificial essential oil of almond it has many other uses such as in manufacturing of dyes, perfumes, flavorings, cinnamic and mandelic acids, and it is also used as a solvent[1]. It is synthesized in laboratories from toluene being chlorinated to benzyl chloride or by direct oxidation of toluene with manganese dioxide. Some more recent developments in the use of benzaldehyde are for the health and agriculture industries. Benzaldehyde is being used as a pesticide and also as an anticancer agent and have shown anti tumour activity in mice.[1,2] It is used as a bee repellent in the harvesting of honey. These uses are still in development but would be very helpful in solving some of these problems of today. The benzaldehyde and its derivatives have received attention because of their chemical and biological importance. The benzaldehyde and substituted benzaldehydes have been subjected to various spectroscopic studies [3-7]. In this light a comparative study is carries out on different aspects of 3-hydroxy-4-methoxy-benzaldehyde (abbreviated and further mentioned as 3,4HMB) and 4-hydroxy-3-methoxy-

357

benzaldehyde (abbreviated and further mentioned as 4,3HMB).

II. EXPERIMENTAL

Spec-pure grade sample of 3,4HMB and 4,3HMB was obtained from M/S Aldrich Chemie, West Germany. The Purity of sample was confirmed by elemental analysis and melting point determination. The laser Raman spectra of both the molecules were recorded on Spex Rama Lab spectrophotometer using 52 MW Argon-Krypton laser beam of wavelength 488 nm. The infrared spectra of these two compounds were recorded on Perkin Elmer spectrophotometer model -52 in the region 400-4000 cm-1 using KBr and nuzol technique.

III. COMPUTATIONAL

All the calculations were carried out for BMB with Gaussian 03W program package [8]using the Becke-3Lee-Yang-Parr (B3LYP) functional supplemented with the standard 6-31G(DP) basis set further referred as DFT calculations. All the parameters were allowed to relax and all the calculations converged to an optimized geometry which corresponds to a true energy minimum, as revealed by the absence of imaginary values in the wave number calculations.

IV. RESULTS AND DISCUSSION A. MOLECULAR STRUCTURE

The molecular structures of the mentioned compounds 3,4HMB and 4,3HMB are shown in

TABLE 1 Calculated Optimized Geometrical Parameters of 3,4HMB, at B3LYP/6-31G(d,p): bond length (Å), bond angle(°), dihedral angles(°)

S.	Atoms	Bon	Angle	Bond	Dihedral	Dihed
Ν	of	d	between	angle	angle	ral
о	molec	leng	atoms (°)	(°)	between	angle
	ule	th			atoms (°)	(°)
		(Å)				

Figure 1 and 2 respectively. The optimized bond lengths, bond angles and dihedral angles of the compounds are calculated by B3LYP method using B3LYP 6-311++G (d) and 6-311++G (D,P) basis sets are listed in Table 1 and 2 respectively and are in accordance with atom numbering scheme as shown in Fig. 1 and 2. Since the exact crystal structures of the reported compounds are not available, the optimized structure can only be compared with other similar system for which the crystal structures have been solved. [9]

The calculated optimised geometrical parameters i.e bond length, bond angle and dihedral angles of both the reported compounds are similar to a greater extent with slight variations thus we can conclude that mere exchanging the positions of the functional groups does not affect the geometries of the compounds very significantly.

B. VIBRATIONAL SPECTRA

A detailed study of vibrational spectra has been carried out of the reported compounds and the vibrational frequencies have been calculated using DFT-B3LYP level with 6-31++G(d,p), there is a good agreement between the observed frequencies and those calculated by the DFT comparative chart is shown in Table 3 in which experimental values of IR (KBr and nuzol), FTIR and laser Raman are displayed and simultaneously compared with the calculated values (scaled and unscaled)

B.I C – C vibrations

The bands in the range 1400-1650 cm-1 are generally assigned to C-C stretching mode .[10] The bands of variable intensity are generally observed at 1625-1590 cm-1, 1590- 1575cm-1, 1540-1470cm-1, 1465- 1430cm-1 and 1380-1280cm-1 from the frequency ranges given by Varsanyi.[11] The bands at 1579 (KBr) /1578(nuzol)/1592 cm-1 Raman for 3,4-HMB and 1590(KBr)/1589(nuzol)/1481 cm-1 Raman for 4,3-HMB have been clearly identified as the components of e1u(1595 cm-1)mode of benzene. The components of e2g(1485 cm-1) mode of benzene have been assigned at 1460 cm-1 for 3,4-HMB and 1464 cm-1 for 4,3-HMB. These values are in fair agreement with the calculated values.

B.II C-H VIBRATIONS

In the high frequency region the bonds observed at 2926cm-1 (nujol) for 3,4-HMB and 2927 cm-1 (nujol) for 4,3-HMB with the counterpart of Raman band at 3031 cm-1 and 2700 cm-1 respectively and 3003cm-1 (KBr) and 2845 cm-1 (KBr) have been identified as ring stretching modes and well lie in the region predicted by Bellamy[12] for this mode. The C-H in-plane bending frequency and out-of-plane bending modes lie in the region 1225-950 cm-1 and 950-650 cm-1 respectivelly[12]. In view of the above, the bands observed at 1023 cm-1 (nujol)/ 1023 cm-1 (KBr) for 3,4-HMB and1071 cm-1(nujol)/

1071 cm-1 (KBr) for 4,3-HMB and very strong Raman band observed at 1129 cm-1 for3,4-HMB and 1106 cm-1 for4,3-HMB respectively have been assigned as C-H (.p.b. mode while the bands observed at 831 cm-1 (KBr)/ 831 cm-1 (nujol) for 3,4-HMB and 839 cm-1 (KBr)/839 cm-1 (nuzol) for 4,3-HMB respectively and strong band at 809 cm-1 for 3,4-HMB and 852 cm-1 for 4,3-HMB respectively in Raman have been identified as C-H o.p.b. mode.

B.III Aldehyde group vibrations

The C-H stretching vibrations of the aldehyde group usually appear in the region 2871–2806 cm-1 [13]. The bands at 2900 cm-1 for Raman and 2937 cm-1(KBr)/ 2926 cm-1(nuzol) for IR are assigned to aldehyde group vibrations and shows close proximity with the calculated value which is 2915.82 cm-1 for3,4HMB whereas the bands at 2700 cm-1 at Raman and 2840 cm-1(KBr)/ 2857 cm-1 (nuzol) for IR are assigned for this group vibration which corresponds to 2918.31 cm-1 for the calculated value for 4,3HMB.

C. THERMODYNAMIC PROPERTIES

Theoretical geometrical parameters represent a good approximation and they are the basis for calculating vibrational frequencies and thermodynamic parameters. The frequency calculations compute the zero point energies, thermal correction to internal energy and entropy as well as the heat capacity for a molecular system. These functions describe the thermodynamic stability of the system at the given conditions of pressure and temperature. The first set and table 4 represents the thermal functions for3,4HMB and second set and table 5 for 4,3HMB respectively.

Zero-point correction = 0.147490 (Hartree/Particle) Thermal correction to Energy = 0.157263 Thermal correction to Enthalpy = 0.158207 Thermal correction to Gibbs Free Energy = 0.112288 Sum of electronic and zero-point Energies = -532.220615 Sum of electronic and thermal Energies = -532.210842 Sum of electronic and thermal Enthalpies = -532.209898 Sum of electronic and thermal Free Energies = -532.255817

TABLE 5

D. ELECTRIC MOMENT

The dipole moment in a molecule is an important property that is mainly used to study the intermolecular interactions involving the nonbonded type dipole-dipole interactions, as we know that higher the dipole moment, stronger will be the intermolecular interactions. In the absence of experimental data, the values of polarizability and hyperpolarizability calculated at the same level of theory and the same basis set for the compounds 3,4BMB and 4,3HMB can provide a satisfactory comparison of these quantities.

The component of dipole moment μ , polarizability α and the first hyperpolarizability β can be calculated by using the following equations

$\mu = (\mu x^2 + \mu y^2 + \mu z^2)^{1/2}$
$\bar{\alpha} = 1/3(\alpha x x + \alpha y y + \alpha z z)$
$\Delta \alpha = 1/\sqrt{2} \{ [(\alpha xx - \alpha yy)2 + (\alpha yy - \alpha zz)2 + (\alpha zz - \alpha yz)2 \} \}$
$\alpha xx)2 + 6 \alpha 2 xz]$]1/2
First order polarizability β = [($\beta xxx + \beta xyy +$
βxzz)2+(βyyy + βxxy + βyzz)2+(βzzz + βxxz +
βyyz)2]1/2

So the table 6 represents the values of dipole moment, polarizability and hyperpolarizability for 3,4HMB and table 7 for 4,3HMB respectively.

TABLE 6

Dipole		Polarizability		Hyperpolarizability	
moment					
	5.0370		-		111.2712
		αxx	63.0787	βxxx

TADI D 7

Dipole		Polarizability		Hyperpolarizability		
moment						
μx	- 2.3742	αxx	- 67.0736	βxxx	-46.9792	
μу	- 0.7684	αуу	- 57.0400	βууу	-17.8053	
μz	0.0008	αzz	- 65.6841	βzzz	0.0013	
		αχγ	14.5315	βхуу	-14.1540	
		αxz	-0.0008	βxxy	9.3349	
		αyz	-0.0013	βxxz	0.0027	
				βxzz	-3.6143	
				βyzz	-6.8465	
				βyyz	0.0002	
				βxyz	0.0016	

Using the values of dipole moment, polarizability and hyperpolarizability from table 6 and 7 for reported compounds 3,4HMB and 4,3HMB respectively we get the values of μ , $\bar{\alpha}$, $\Delta \alpha$ and β as follows :-

For 3,4HMB

For 4,3HMB

µ= 5.1943

μ= 2.4954

- $\bar{\alpha} = 63.2659$
- $\bar{\alpha}=63.2659$

 $\Delta \alpha = 3.8573$ $\Delta \alpha = 9.4161$ $\beta = 133.3220$ $\beta = 66.5344$

V. CONCLUSION

In the present work we have calculated and compared the geometric parameters, the vibrational frequencies and NLO properties of 3-hydroxy-4methoxy-benzaldehyde and 4-hydroxy-3-methoxybenzaldehyde by using Becke-3Lee-Yang-Parr (B3LYP) functional supplemented with the standard 6-31G (DP) basis and compared these values with the experimentally recorded FTIR, IR (KBr and nuzol) and Raman spectra. In general, a good agreement between experimental and calculated normal modes of vibrations have been observed. We also calculated thermodynamic properties as heat capacity, entropy, enthalpy and Gibb's free energy of the titled compounds at different temperatures along with dipole moment, polarisability and hyperpolarisability.
