ABSTRACT

Molecular interaction such as solute-solute, solute-solvent and solvent-solvent interactions in the substituted azomethine drug in the different percentage of organic solvent has been pointed out. In the present work refractive index and the densities of the substituted azomethine in different percent of various organic solvents were reported. The data thus helps to determines Molar refraction (Rm) and polarizability constant (α) of some different substituted azomethine in binary mixture. Observations showed that the molar refraction and polarizability constant of substituted azomethine drugs increases with increase in percent composition of organic solvents.

Keyword: Substituted azomethine, molar refraction (Rm), polarizability constant (α), refractometry. refractive index.

I. INTRODUCTION

Refractive index of a liquid is very important property, which gives ideas about geometry and structure of molecule .The refractive index (n) of the medium is the ratio of the velocity of light in vacuum to that in the medium. Its value depends upon the temperature and the wavelength of light used. Generally, the D-line of sodium is used for standard measurements. The refractive index is the ratio of angle of incident to the angle of refraction. . Measurement of refractive index shows very interesting applications in pharmaceutical, chemical, agriculture, food, oil and beverage industries.

Many searcher have reported the refractive indices in mixed solvents[1-4]. The properties of liquid such as viscosity, refractive index and ultrasonic velocity of binary mixtures are studied by many workers [5-8]. Refractrometric Study of S-trizinothiocarbamides in Dioxane-water was also reported. [9]. The viscometric, refractometric and interferometric measurements are very important in medicinal and drug chemistry role [10-12]. Oswal et al[13] have studied dielectric constants and refractive indices of binary mixtures. Dadhichi et al [14] have investigated the measurement of viscosity, refractivity index and metal ligand stability constant of substituted benzofurones in different solvents. Refractive indices of binary, ternary liquid solutions and solutions of biologically important compounds have been studied [15–21].

II. MATERIAL & METHOD

In the present investigation, refractive indices of liquid mixtures were measured with the help of Abbe's refractometer, specially designed to measure the refractive indices of the small quantities of the transparent liquid by direct reading. The ligands of which physical parameters is to be explore are synthesized by using reported protocol.. The solutions of ligand in different percent composition of binary mixtures were prepared by weight. All the weighing were made on one pan digital balance (petit balance AD_50B) with an accuracy of (±0.001)gm.. The densities of solutions were determined by a precalibrated bicapillary pyknometer (± 0.1%). The constant temperature of the prism box is maintained by circulating water from thermostat at (27± 0.1)0C.

Calculation :

The molar refraction of solvent and solution are determined by using Lorentz- Lorentz equation.
The molar refraction of different solvent, mixtures are determined from-
RDMF-W = X1R1 + X2R2 (1)
where , R1 and R2 are molar refractions of DMF and water respectively.
The molar refraction of solutions of ligand in DMF-water mixtures are determined from-
( ) {[ ]} ……. (2)
( )

where, n is the refractive index of solution,X1 is mole fraction of DMF, X2 is mole fraction of water and X3 is mole fraction of solute, M1, M2 and M3 are molecular weights of DMF, water and solute respectively. 'd' is the density of solution.
The molar refraction of ligand is calculated as –
Rlig = Rmix - RDMF – w (3)
The polarizability constant ( ) of ligand is calculated from following relation-
Rlig = 4/3 No ……. (4) where, No is Avogadro's number.

III. RESULT AND DISCUSSION

Table 1: Values of Molar Refraction of different composition of solvents.

% of Solvent Mixture	Molar polarization Rm		
	DMSO	Dioxane	Ethanol

Graphical representation of molar polarization (Rm) of all ligand at 0.01M verses concentration in different percentage of DMSO solvent

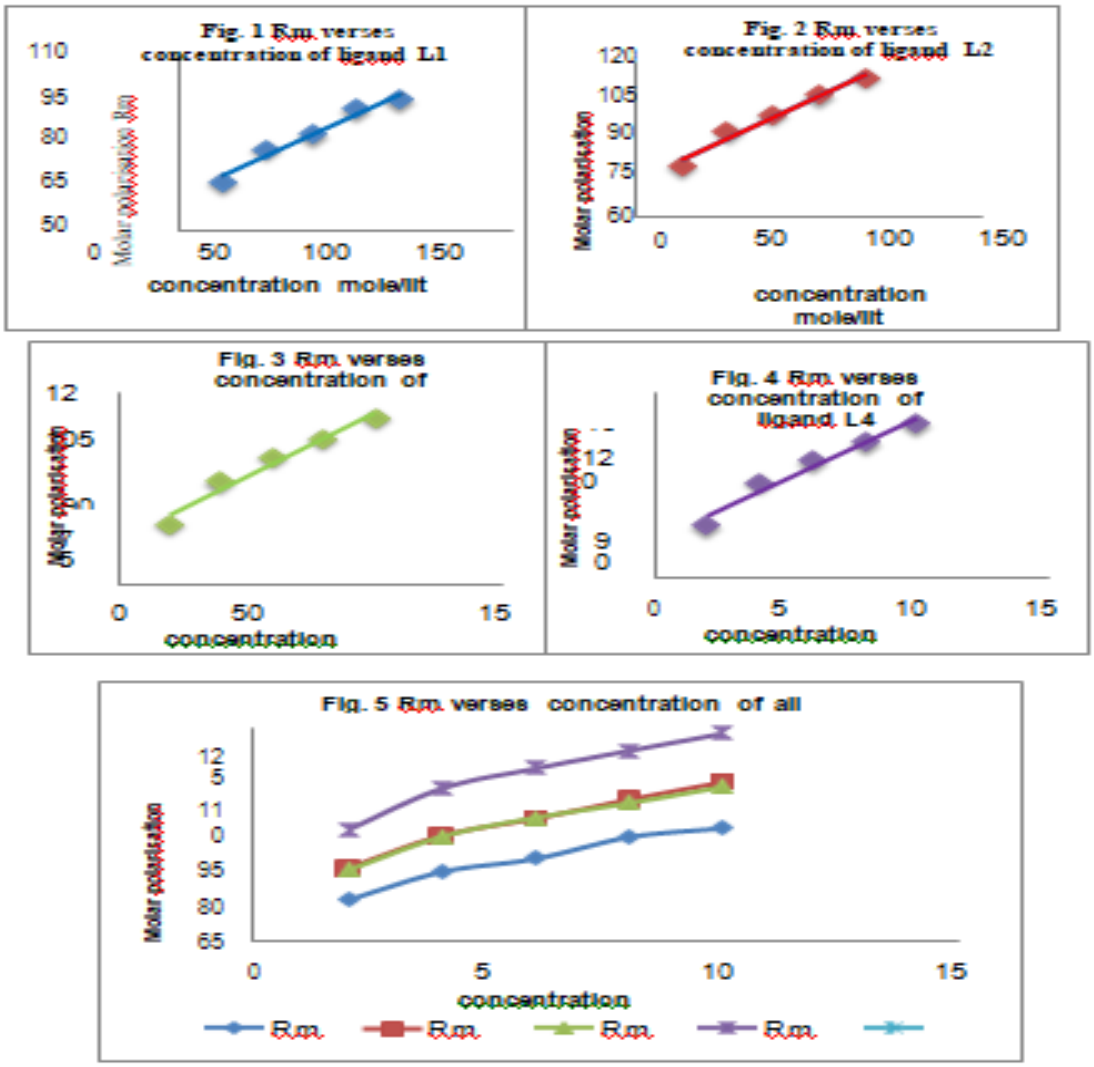

Fig. 1 Rm verses concentration of ligand L1

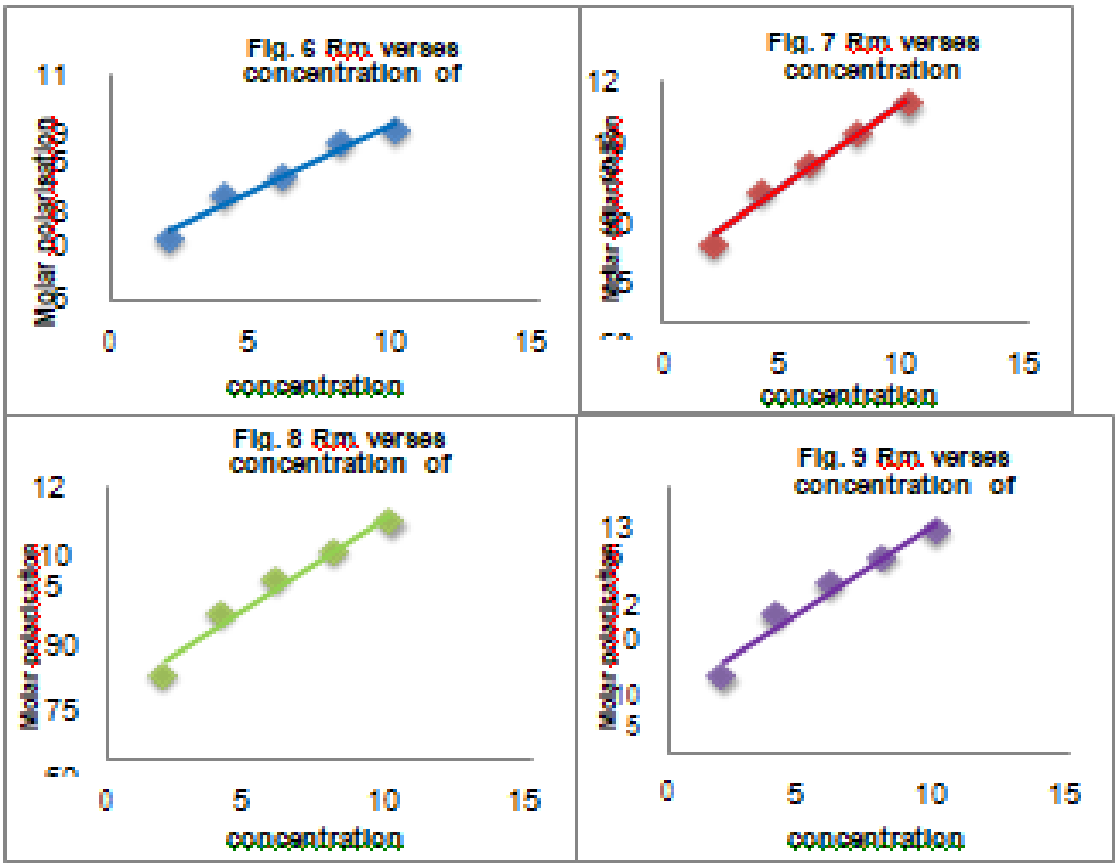
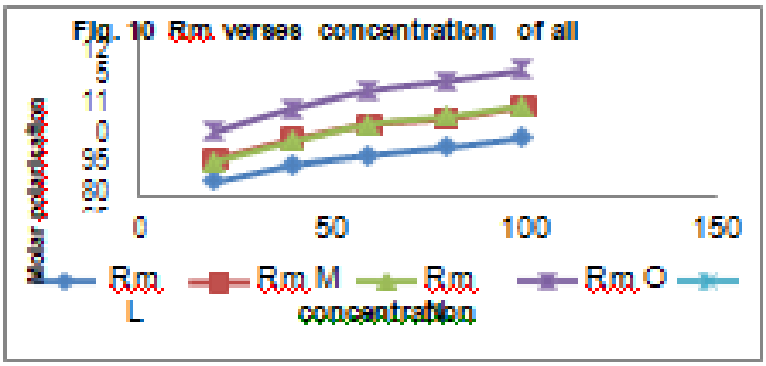
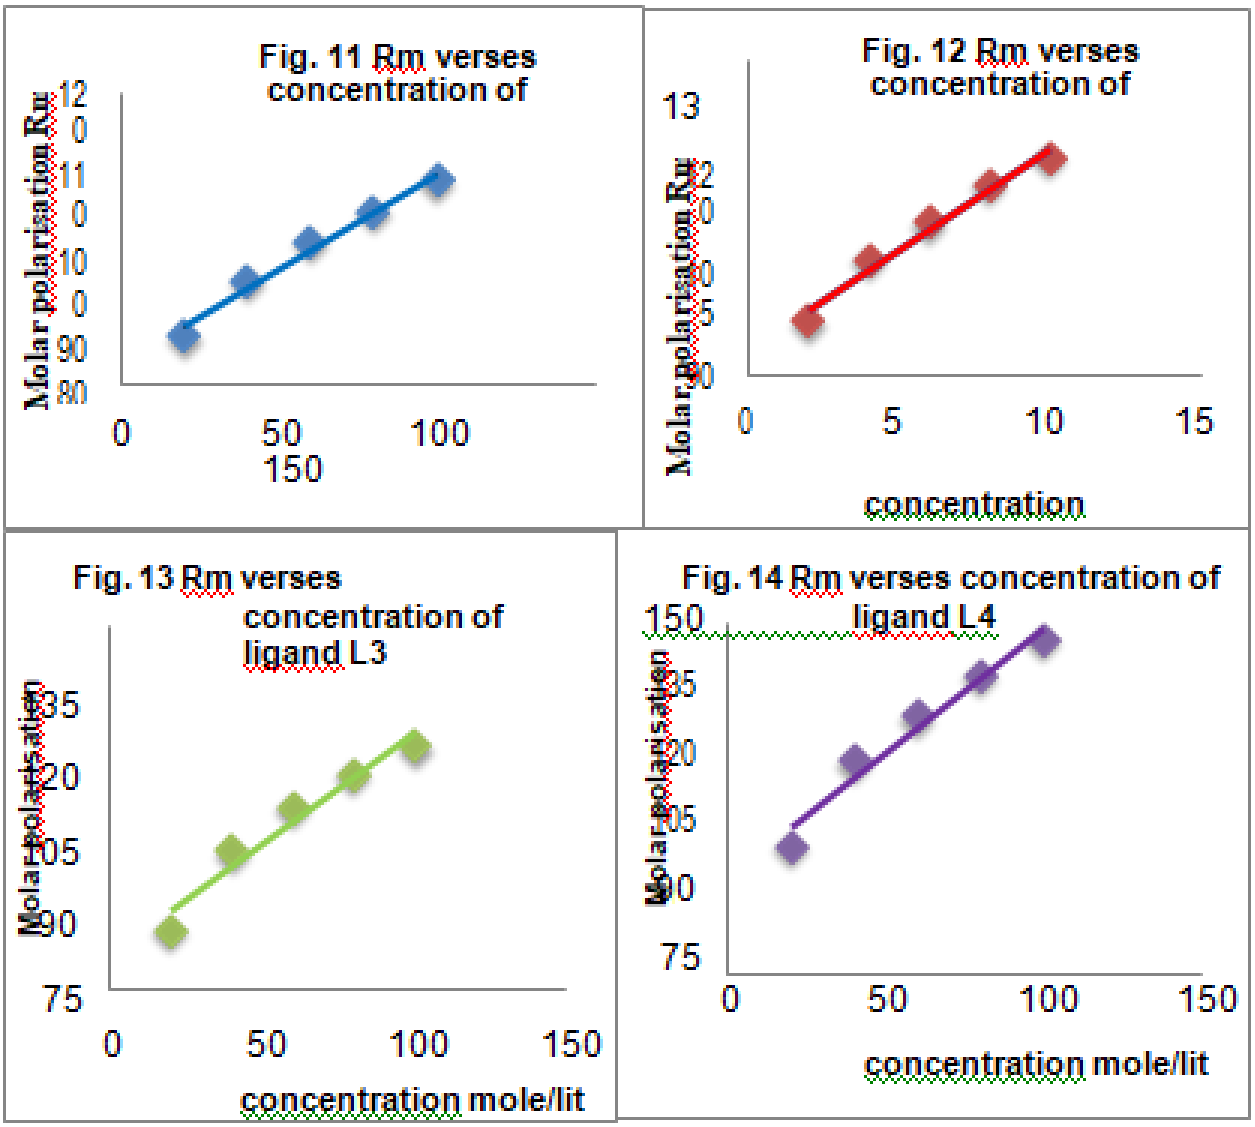
Graphical representation of molar polarization (Rm) of all ligand at 0.01M verses concentration in different percentage of 1,4 Dioxane solvent





Graphical representation of molar polarization (Rm) of all ligand at 0.01M verses concentration in different percentage of Ethanol solvent



The value of molar refraction of different percent composition in binary mixture are shown in table-1. From the data it is observed that value of molar refraction goes on increasing with the decrease in amount of water in percent composition. Comparatively molar refraction of DMSO is greater than acetone and methanol this is due to more value of dipole moment of DMSO.

Table-2 shows the comparative data of refractive indices and densities of DMSO, acetone and methanol in different percent composition with water. From this, it is observe that, refractive index and density increases with the increase in percent composition of organic solvent. Graphical representation between molar refraction and percent composition of DMSO, methanol and acetone shows linear relationship. (Fig.1-5 DMSO, fig.6-10 methanol, fig.11- 15 acetone) Those solvent having more value of dipole moment shows greater refractive index and density, also there is same trend in case of ligand used. Ligand having more dipole moment shows greater value of refractive index and less value of density.

Table-3 shows the comparative data of molar refraction and polarizability constant. These parameter provide important information about structural orientation of ligand in solution. From this it is observed that, molar refraction and polarizability constant in methanol is higher than DMSO and acetone. The trend regarding

increasing value of molar refraction and polarizability constant is methanol > DMSO > acetone. From this observation it is concluded that, methanol has strong hydrogen bonding, which make solution more viscous which is responsible for more bending of light towards normal. In case of DMSO, it has more value of molar refraction and polarizability constant than acetone because it has more dipole moment.
